#### **DETAILED ACTION**

## Response to Arguments

1. In a response filed 03/08/2005, the applicant objected to the Official Notice taken by the examiner in the previous Office Action and requested objective proof as required by MPEP 2144.03. As provided for in this section of the MPEP, the new reference has been cited below and the action is made final.

## Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-4, 6-8, 10, 14, 15, 17, 18, and 22-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kangsharju in view of Multer et al. (USPN 6,694,336).
- 4. Regarding claim 1, Kangasharju et al. teach a system for reporting status information from a plurality of content exchanges to a remote system, the system comprising:
  - a. A server at the remote location including a plurality of content objects (abstract; page 5, column 2, paragraph 4).
  - b. A first content exchange comprising a first subset of content portions of the plurality of content objects, the first subset obtained from the server (abstract, lines 1-3; page 2, column 2,

Art Unit: 2153

paragraph 3). Note that in the reference, cache servers are content exchanges.

- c. A second content exchange comprising a second subset of content portions the plurality of content objects (abstract, lines 1-3; page 2, column 2, paragraph 3).
- d. A first datalink that transports a first catalog of the first subset between the first content exchange and a server (page 5, column 2, paragraph 4; page 6, column 1, paragraph 1).
- e. A second datalink that transports a second catalog of the second subset between the second content exchange and a server (page 5, column 2, paragraph 4; page 6, column 1, paragraph 1).

Although the system disclosed by Kangasharju shows substantial features of the claimed invention, it fails to disclose specifically means wherein the content exchanges return catalog information to the same server from which the content object portions are obtained.

Nonetheless, these features are well known in the art and it would have been an obvious modification of the system disclosed by Kangasharju as evidenced by Multer et al. (USPN 6,694,336).

In an analogous art, Multer et al. (USPN 6,694,336) discloses a system for data transfer and synchronization wherein the content exchanges return catalog information to the same server from which the content object portions are

Art Unit: 2153

obtained (abstract; column 3, lines 63-67; column 4, lines 13-20; column 8, lines 34-39).

Given the teaching of Multer et al. (USPN 6,694,336), a person having ordinary skill in the art would have readily recognized the desirability and advantages of modifying Kangasharju by sending the catalogs of the content exchanges back to the server that houses the original content. This benefits the system by allowing the remote server to automatically update the content exchanges as well as notify other connected caches about the contents stored on the updated content exchanges.

- Regarding claim 2, Kangasharju teach all the limitations as applied to claim 1. They further teach means wherein the first and second catalogs comprise a plurality of entries (page 6, column 1, paragraph 2). Note that content updates can be sent in batches.
- 6. Regarding claim 3, Kangasharju teach all the limitations as applied to claim 2. They further teach means wherein at least one of the plurality of entries comprises a content object filename, a path, and a server name (page 6, column 1, paragraph 2). Note that web page information is stored, this necessarily includes a server name, path, and filename for each object cached.
- 7. Regarding claim 4, Kangasharju teach all the limitations as applied to claim 1. They further teach means wherein at least one of the first and second datalinks transport over the Internet (page 6, column 1, paragraph 2).
- 8. Regarding claim 6, Kangasharju teach all the limitations as applied to claim 1. They further teach means wherein the first datalink transports status

Art Unit: 2153

information relating to the first content exchange (abstract; page 2, column 1, paragraph 3).

- 9. Regarding claim 7, Kangasharju teach all the limitations as applied to claim 1. They further teach means wherein at least one of the first and second content exchanges checks an operational status of the server (page 2, column 1, paragraph 1).
- 10. Regarding claim 8, Kangasharju teach a system for reporting information to remote locations in a content distribution system with means for:
  - a. Determining, at a content exchange, a first catalog of a first plurality of content object portions obtained from a first server at a first remote location (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2).
  - b. Determining, and the content exchange, a second catalog of a second plurality of content object portions obtained from a second server at a second remote location (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2).
  - c. Transporting the first catalog to a remote location (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2).
  - d. Transporting the second catalog to a remote location (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2).
  - e. Detecting changes to one of the first and second catalogs (page6, column 1, paragraph 2).

Art Unit: 2153

f. Transporting the changes to a remote location (page 6, column1, paragraph 2).

f. paragraph 1).

Although the system disclosed by Kangasharju shows substantial features of the claimed invention, it fails to disclose specifically means wherein the content exchanges return catalog information to the same server from which the content object portions are obtained.

Nonetheless, these features are well known in the art and it would have been an obvious modification of the system disclosed by Kangasharju as evidenced by Multer et al. (USPN 6,694,336).

In an analogous art, Multer et al. (USPN 6,694,336) discloses a system for data transfer and synchronization wherein the content exchanges return catalog information to the same server from which the content object portions are obtained (abstract; column 3, lines 63-67; column 4, lines 13-20; column 8, lines 34-39).

Given the teaching of Multer et al. (USPN 6,694,336), a person having ordinary skill in the art would have readily recognized the desirability and advantages of modifying Kangasharju by sending the catalogs of the content exchanges back to the server that houses the original content. This benefits the system by allowing the remote server to automatically update the content exchanges as well as notify other connected caches about the contents stored on the updated content exchanges.

Art Unit: 2153

11. Regarding claim 10, Kangasharju teach all the limitations as applied to claim 8. They further teach means for reporting t the first and second servers status information at a predetermined interval (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2). Note that the batch sending allows a cache to set an interval after which data will be sent.

Page 7

- 12. Regarding claim 14, teach all the limitations as applied to claim 8. They further teach means wherein the transporting comprises transporting via the Internet (page 6, column 1, paragraph 2).
- 13. Regarding claim 15, Kangasharju teach a system for tracking information in a content distribution system with means for:
  - a. Receiving, at a server, a first content catalog of first content object portions from a first remote computer, the first content object portions obtained by the first remote computer from a server (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2).
  - b. Receiving, at a server, a second content catalog of second content object portions from a second remote computer, the second content object portions obtained by the second remote computer from a server (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2).
  - c. Updating a content database with information from the first and second content catalogs (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2).

Art Unit: 2153

d. Receiving a third content catalog from the first remote computer that is different from the first content catalog (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2).

- e. Receiving a fourth content catalog from the second remote computer that is different from the second content catalog (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2).
- f. Updating the content database with information from the third and fourth content catalogs (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2). Note that the nature of updating requires that when a new catalog comes in, it replaces the information that has changed from the previous catalog.
- g. paragraph 1).

Although the system disclosed by Kangasharju shows substantial features of the claimed invention, it fails to disclose specifically means wherein the content exchanges return catalog information to the same server from which the content object portions are obtained.

Nonetheless, these features are well known in the art and it would have been an obvious modification of the system disclosed by Kangasharju as evidenced by Multer et al. (USPN 6,694,336).

In an analogous art, Multer et al. (USPN 6,694,336) discloses a system for data transfer and synchronization wherein the content exchanges return catalog information to the same server from which the content object portions are

Art Unit: 2153

obtained (abstract; column 3, lines 63-67; column 4, lines 13-20; column 8, lines 34-39).

Given the teaching of Multer et al. (USPN 6,694,336), a person having ordinary skill in the art would have readily recognized the desirability and advantages of modifying Kangasharju by sending the catalogs of the content exchanges back to the server that houses the original content. This benefits the system by allowing the remote server to automatically update the content exchanges as well as notify other connected caches about the contents stored on the updated content exchanges.

- 14. Regarding claim 17, Kangasharju teach all the limitations as applied to claim 15. They further teach means for receiving status information related to one of the first and second remote computers (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2).
- 15. Regarding claim 18, Kangasharju teach all the limitations as applied to claim 15. They further teach means for providing status information to the first and second computers (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2).
- 16. Regarding claim 22, Kangasharju teach all the limitations as applied to claim 1. They further teach means wherein accessing a content object includes accessing a first content object portion from one of the first subset of the first plurality of content object portions and the second subset of the second plurality of content object portions, and a second content object portion from one of the first plurality of content object portions and the second plurality of content object

Art Unit: 2153

portions (abstract, lines 1-3; page 2, column 2, paragraph 3; page 5, column 2, paragraph 4; page 6, column 1, paragraph 1). Note that given the wording of this claim, all content object portions may reside in the same subset.

- 17. Regarding claim 23, Kangasharju teaches all the limitations as applied to claim 1. They further teach means wherein the first subset of the plurality of content object portions includes a first portion of a first content object and the first sybset does not include a second portion of the first content object (page 5, column 2, paragraph 4; page 6, column 1, paragraph 1).
- 18. Regarding claim 24, Kangasharju teaches all the limitations as applied to claim 1. They further teach means wherein the content object is one of a content file and a content stream (page 5, column 2, paragraph 4; page 6, column 1, paragraph 1).
- 19. Claims 5, 9, 11, 13, 16, 19, and 20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kangasharju et al. (1999) in view of Chase et al. (EP 0 877 326 A2).
- 20. Regarding claim 5, although the system disclosed by Kangasharju et al. (1999) (as applied to claim 1) shows substantial features of the claimed invention, it fails to disclose means wherein the first subset of the first plurality of content object portions is purged from the first content exchange when the server becomes unavailable.

Nonetheless, these features are well known in the art and would have been an obvious modification of the system disclosed by Kangasharju et al. (1999), as evidenced by Chase et al. (EP 0 877 326 A2).

Art Unit: 2153

In an analogous art, Chase et al. (EP 0 877 326 A2) disclose a system for distributed caching of web accessible data wherein the first subset of the first plurality of content object portions is purged from the first content exchange when the server becomes unavailable (figure 4, element 400).

Given the teaching of Chase et al. (EP 0 877 326 A2), a person having ordinary skill in the art would have readily recognized the desirability and advantages of modifying Kangasharju et al. (1999) by employing the purging of cache information when the origin server is no longer available. This benefits the system by causing users to realize the origin server is no longer in operation and that they are no longer able to view the information that was cached. Note that this would be a consequence of sending updates to the origin server of what was being saved.

21. Regarding claim 9, Kangasharju et al. (1999) teach all the limitations as applied to claim 8. They further teach means for determining the first server is unavailable (page 5, column 2, paragraph 4; page 6, column 1, paragraph 2). Note that in the reference, the client would know the status of the server upon request.

Although the system disclosed by Kangasharju et al. (1999) shows substantial features of the claimed invention, it fails to disclose means for purging the first plurality of content object portions in response to the determining the first server is unavailable.

Art Unit: 2153

Nonetheless, these features are well known in the art and would have been an obvious modification of the system disclosed by Kangasharju et al. (1999), as evidenced by Chase et al. (EP 0 877 326 A2).

In an analogous art, Chase et al. (EP 0 877 326 A2) disclose a system for distributed caching of web accessible data with means for purging the first plurality of content object portions in response to the determining the first server is unavailable (figure 4, element 400).

Given the teaching of Chase et al. (EP 0 877 326 A2), a person having ordinary skill in the art would have readily recognized the desirability and advantages of modifying Kangasharju et al. (1999) by employing the purging of cache information when the origin server is no longer available. This benefits the system by causing users to realize the origin server is no longer in operation and that they are no longer able to view the information that was cached. Note that this would be a consequence of sending updates to the origin server of what was being saved.

22. Regarding claim 11, although the system disclosed by Kangasharju et al. (1999) (as applied to claim 8) shows substantial features of the claimed invention, it fails to disclose means for reporting to the first and second servers an impending unavailability of a content exchange.

Nonetheless, these features are well known in the art and would have been an obvious modification of the system disclosed by Kangasharju et al. (1999), as evidenced by Chase et al. (EP 0 877 326 A2).

Art Unit: 2153

In an analogous art, Chase et al. (EP 0 877 326 A2) disclose a system for distributed caching of web accessible data with means for reporting to the first and second servers an impending unavailability of a content exchange (figure 4, element 400).

Given the teaching of Chase et al. (EP 0 877 326 A2), a person having ordinary skill in the art would have readily recognized the desirability and advantages of modifying Kangasharju et al. (1999) by employing the notification of a soon to be unavailable machine. This benefits the system by allowing the server to avoid holding information on caches that may be corrupted or emptied when they became unavailable.

23. Regarding claim 13, although the system disclosed by Kangasharju et al. (1999) (as applied to claim 8) shows substantial features of the claimed invention, it fails to disclose means for purging information from a content location database when a content exchange becomes unavailable.

Nonetheless, these features are well known in the art and would have been an obvious modification of the system disclosed by Kangasharju et al. (1999), as evidenced by Chase et al. (EP 0 877 326 A2).

In an analogous art, Chase et al. (EP 0 877 326 A2) disclose a system for distributed caching of web accessible data with means for purging information from a content location database when a content exchange becomes unavailable (figure 4, element 400).

Given the teaching of Chase et al. (EP 0 877 326 A2), a person having ordinary skill in the art would have readily recognized the desirability and

Art Unit: 2153

advantages of modifying Kangasharju et al. (1999) by employing the purging of information relating to an unavailable host or intermediate cache. This benefits the system by allowing the server to avoid holding information on caches that may have been corrupted or emptied when they became unavailable.

24. Regarding claim 16, although the system disclosed by Kangasharju et al. (1999) (as applied to claim 15) shows substantial features of the claimed invention, it fails to disclose means for updating the content database when one of the first and second remote computers is unavailable.

Nonetheless, these features are well known in the art and would have been an obvious modification of the system disclosed by Kangasharju et al. (1999), as evidenced by Chase et al. (EP 0 877 326 A2).

In an analogous art, Chase et al. (EP 0 877 326 A2) disclose a system for distributed caching of web accessible data with means for updating the content database when one of the first and second remote computers is unavailable (figure 4, element 400).

Given the teaching of Chase et al. (EP 0 877 326 A2), a person having ordinary skill in the art would have readily recognized the desirability and advantages of modifying Kangasharju et al. (1999) by employing the updating of information relating to an unavailable host or intermediate cache. This benefits the system by allowing the server to avoid holding information on caches that may have been corrupted or emptied when they became unavailable.

25. Regarding claim 19, although the system disclosed by Kangasharju et al. (1999) (as applied to claim 15) shows substantial features of the claimed

Art Unit: 2153

invention, it fails to disclose means for notifying the first and second computers of impending unavailability.

Nonetheless, these features are well known in the art and would have been an obvious modification of the system disclosed by Kangasharju et al. (1999), as evidenced by Chase et al. (EP 0 877 326 A2).

In an analogous art, Chase et al. (EP 0 877 326 A2) disclose a system for distributed caching of web accessible data with means for notifying the first and second computers of impending unavailability (figure 4, element 400).

Given the teaching of Chase et al. (EP 0 877 326 A2), a person having ordinary skill in the art would have readily recognized the desirability and advantages of modifying Kangasharju et al. (1999) by informing intermediate caches of an unavailable server. This benefits the system by allowing the computers to no longer hold cached information from an unavailable server that may be in update or not coming back online.

26. Regarding claim 20, although the system disclosed by Kangasharju et al. (1999) (as applied to claim 15) shows substantial features of the claimed invention, it fails to disclose means for receiving notification from one of the first and second computers of impending unavailability.

Nonetheless, these features are well known in the art and would have been an obvious modification of the system disclosed by Kangasharju et al. (1999), as evidenced by Chase et al. (EP 0 877 326 A2).

In an analogous art, Chase et al. (EP 0 877 326 A2) disclose a system for distributed caching of web accessible data with means for receiving notification

Art Unit: 2153

from one of the first and second computers of impending unavailability (figure 4, element 400).

Given the teaching of Chase et al. (EP 0 877 326 A2), a person having ordinary skill in the art would have readily recognized the desirability and advantages of modifying Kangasharju et al. (1999) by informing the server of unavailable intermediate caches. This benefits the system by allowing the server to avoid holding information on caches that may have been corrupted or emptied when they became unavailable.

- 27. Claim 12 is rejected under 35 U.S.C. 103(a) as being unpatentable over Kangasharju et al. (1999) (as applied to claim 8) in view of Tsirigotis et al. (EP 0 847 020 A2).
- 28. Regarding claim 12, although the system disclosed by Kangasharju et al. (1999) (as applied to claim 8) shows substantial features of the claimed invention, it fails to disclose means for:
  - a. Receiving a preload command.
  - b. Preloading at least one content object portion from a remote server in response to receiving the preload command.

Nonetheless, these features are well known in the art and would have been an obvious modification of the system disclosed by Kangasharju et al. (1999), as evidenced by Tsirigotis et al. (EP 0 847 020 A2).

In an analogous art, Tsirigotis et al. (EP 0 847 020 A2) discloses a system for distributed caching with means for:

a. Receiving a preload command (column 2, lines 30-32).

Art Unit: 2153

b. Preloading at least one content object portion from a remote server in response to receiving the preload command (column 2, lines 21-36).

Given the teaching of Tsirigotis et al. (EP 0 847 020 A2), a person having ordinary skill in the art would have readily recognized the desirability and advantages of modifying Kangasharju et al. (1999) by employing the preloading of content. This benefits the system by allowing users to have faster access to information that they are most likely to request.

### Conclusion

29. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kevin Parton whose telephone number is
